Abstract

FlowOps is an integrated Agile, DevOps, and Security Workflow Management Platform designed to support software development teams throughout the software development lifecycle. The system combines essential Agile and Scrum practices such as project management, user stories, product backlog management, sprint planning, task management, Kanban workflow, and testing into a unified platform. It provides role-based access for Project Managers, Developers, and Testers, enabling each team member to perform responsibilities according to their role.

The platform also provides Agile analytics, including sprint progress, story points, team velocity, task distribution, and burndown charts, helping teams monitor project performance and development progress. In addition, FlowOps incorporates DevOps and security concepts by providing support for CI/CD status monitoring, Docker-based deployment, code quality analysis, vulnerability tracking, and application observability.

The system is developed using React.js for the frontend, Spring Boot for the backend, MySQL for data management, and technologies such as JWT authentication, Docker, GitHub Actions, Prometheus, and Grafana to support secure and modern software engineering practices. Overall, FlowOps provides a centralized platform that demonstrates the complete workflow from Software Engineering and Agile Development to DevOps, Security, and Monitoring, making it suitable for managing and demonstrating modern software development processes.
